

DataMind-Build: Workspace-to-Surface Materialization

The Build Agent converts mutable workspace to immutable profile

1. Workspace sources

Documents • tables
Code • files • memory

2. Inspect and plan

Profile roots • check-
sums
Surface candidates •
manifest

3. Parse and normal- ize

MinerU / pypdf •
office→PDF
Typed rows • source
locators

4. Project surfaces

Document • table •
graph
Memory records with
source identity

5. Validate candidate

Source coverage •
schema
Duplicate and locator
checks

6. Record receipts

Source • operation •
status
Revision • idempot-
ence

7. Publish snapshot

Candidate becomes
visible
Only after all checks
pass

8. Serve the profile

Serving Agent reads
the
published revision vec-
tor

Shared DataMind semantics: profile policy • provenance • receipts • revisions • recovery
